EXPERIMENT 1

Comparative Study of Low-Code Development versus Traditional Application Development

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Compare low-code development with traditional coding and identify why Zoho Creator is suitable for an insurance-claim workflow.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

Low-code platforms provide visual form builders, reports, workflows and integrations with limited hand-written code. Traditional development provides more direct control over architecture and code, but usually requires more implementation and maintenance effort.

Procedure

1. Define the insurance-claim problem: capture claimant, policy, incident, amount and supporting evidence.

2. Compare both approaches for development time, skills, customization, testing, deployment and maintenance.

3. Map the current Insurance Claim Command Center to low-code capabilities: forms, reports, fields, calculations and workflow options.

4. Record trade-offs and select the approach suitable for a college-scale claim-management application.

Design / Observation Table

Factor	Low-code / Zoho Creator	Traditional development
Initial build	Visual forms and reports accelerate setup	Forms, APIs and database often coded manually
Customization	Deluge and supported extensions; platform boundaries apply	Broad control over code and architecture
Maintenance	Platform-managed infrastructure; configuration still needs governance	Team manages code, dependencies and deployment
Best fit	Internal workflow apps and rapid prototypes	Highly specialized systems needing full control

Result / Conclusion

Low-code is a practical fit for quickly building an insurance claim intake and tracking prototype. Traditional development may be preferable where deep architectural control, complex integrations or platform independence are critical.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
