EXPERIMENT 3

# Survey Report on Emerging Trends in Low-Code Application Development

Insurance Claim Request & Processing Management | Zoho Creator

## Objective

Review key trends that influence the design and future development of low-code insurance applications.

## Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

## Theory

Common low-code trends include AI-assisted building, reusable components, API-based integration, mobile-friendly interfaces, analytics, governance controls and pro-code extensions. Availability varies by platform and plan.

## Procedure

1. Identify trends relevant to claims processing: AI-assisted data capture, workflow automation, analytics, integrations and mobile evidence submission.

2. Assess potential benefits for claimants and claims officers.

3. Identify risks such as privacy exposure, platform lock-in, incorrect AI output and uncontrolled app sprawl.

4. Recommend a phased adoption plan with human review, access control, testing and auditability.

## Design / Observation Table

| Trend | Potential insurance use | Control to consider |
|---|---|---|
| AI assistance | Help classify claim text or summarize evidence | Human verification; avoid auto-deciding claims |
| Workflow automation | Acknowledgements and task routing | Failure alerts and audit trail |
| Analytics | Claim volume, type and status trends | Accurate definitions and data quality |
| API integration | Connect policy or messaging systems | Authentication and least privilege |
| Pro-code extension | Custom functions or external services | Versioning, testing and monitoring |

## Result / Conclusion

Low-code is evolving from form creation toward integrated workflow platforms. For insurance, prioritize safe automation, reliable integrations and responsible use of AI.

## Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
