EXPERIMENT 5

Building Reports, Dashboards and Custom Pages for the Application

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Present claim records in useful views so the claims team can monitor incoming requests and processing status.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

Reports expose stored records in list, spreadsheet, calendar, kanban or other supported formats. Dashboards and custom pages can summarize workload using counts and charts, subject to available platform features.

Procedure

1. Create a report from Claim_Request_Form and display claim reference, policy number, claimant, claim type, amount, incident date and status.

2. Add filters for Claim_Type, Claimant_Type and Claim_Status; sort incident dates with the newest first where appropriate.

3. Create a kanban-style view grouped by Claim_Status if supported.

4. Design a dashboard with total claims, claims under investigation, approved claims and claims awaiting settlement.

5. Preview each view with test records and verify that only appropriate fields are exposed to each user role.

Design / Observation Table

View	Purpose
All Claims List	Daily claim review and filtering
Spreadsheet	Bulk review and export-oriented analysis
Status Kanban	Visualize work by processing stage
Incident Calendar	Review incidents by date
Dashboard page	Summarize volume, status and claim type

Result / Conclusion

Multiple report styles support different tasks. The supplied app export contains All_Claims_List, Claims_Spreadsheet, Claim_Status_Kanban and Incident_Date_Calendar; dashboard elements should be verified in the live app.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
