EXPERIMENT 7

# Integrating Zoho Creator with Another Zoho Service Using Connections and APIs

Insurance Claim Request & Processing Management | Zoho Creator

## Objective

Plan a secure integration between the insurance-claim application and a relevant Zoho service or external API.

## Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

## Theory

Connections store authorized access for supported services. APIs allow applications to exchange data, but integrations require correct scopes, field mapping, error handling and data minimization.

## Procedure

1. Choose one integration use case, such as sending an acknowledgement through an authorized Zoho service or creating a task for a claims officer.

2. Identify the data required: claim reference, claim type, status and recipient address only when necessary.

3. Create an authorized connection with the minimum required scopes, following the current Zoho interface.

4. Map source fields to destination fields and configure a controlled test request.

5. Test successful response, expired authorization, invalid input, rate limit and service outage; document how errors are handled.

## Design / Observation Table

| Integration element | Insurance example |
|---|---|
| Source | Claim_Request_Form |
| Trigger | New claim or status change |
| Payload | Claim reference, claim type, current status |
| Destination | Authorized Zoho service / API |
| Safeguard | Least privilege, minimal personal data, error logging |

## Result / Conclusion

A connection-based integration can reduce manual re-entry. This report is a design and implementation guide; a working integration requires credentials, permissions and testing in the user's account.

## Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
