EXPERIMENT 9

Exploring AI-Assisted Features and Built-in Analytics (Zia)

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Evaluate where AI assistance and analytics could support claim intake and operational reporting without replacing human claim decisions.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

AI-assisted features may help summarize text, classify information or reveal patterns, depending on the product edition and enabled capabilities. Analytics can describe volumes and status distributions. AI output may be inaccurate and must be reviewed.

Procedure

1. Identify a narrow use case, such as summarizing an incident description for an officer or grouping claims by type.

2. Prepare synthetic or appropriately de-identified sample records.

3. Check which Zia or AI features are actually available in the current Zoho Creator account.

4. Compare AI-assisted summaries or categories against human-reviewed results.

5. Document accuracy, failure cases, privacy constraints and a human-review step; do not use the model alone to approve or reject claims.

Design / Observation Table

Use case	Evaluation measure	Safeguard
Incident summary	Important facts retained	Officer verifies against original description
Claim category suggestion	Agreement with human label	User can correct the suggestion
Trend analysis	Correct counts and filters	Check source data quality
Anomaly flag	Useful review leads	Never treat flag as proof of fraud

Result / Conclusion

AI and analytics can assist triage and reporting, but availability is account-dependent and outputs need human verification. No AI feature is assumed to be enabled merely because it is discussed here.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
