EXPERIMENT 10

Performance Optimization: Indexing, Subforms and Query Tuning

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Identify ways to keep claim reports and data entry responsive as the number of insurance claims grows.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

Performance depends on record volume, report columns, filters, formulas, related records and workflow complexity. Indexing or query controls may be available only in specific contexts or editions, so platform-supported options must be verified.

Procedure

1. Use a representative set of test claim records and note load times for the main report.

2. Keep list reports focused on fields needed for routine triage; move long descriptions and evidence into record detail views.

3. Use useful filters such as Claim_Status, Claim_Type and incident date.

4. Review calculated fields such as Net_Payable_Amount and avoid repeating expensive calculations unnecessarily.

5. Use subforms or related records for repeating witness or document details where appropriate; test after each change.

Design / Observation Table

Technique	Potential benefit
Limit report columns	Less data rendered per row
Selective filters	Narrower record set for review
Related/subform data	Organize repeating witnesses or documents
Formula review	Avoid unnecessary recalculation
Performance tests	Detect regressions before deployment

Result / Conclusion

A focused report design and measured testing are practical first steps. Do not claim indexing or query tuning is enabled unless the relevant Creator capability is available and configured.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
