EXPERIMENT 15

Career Pathways and the Future of Low-Code Development

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Summarize career roles and skills associated with low-code development and its likely direction in business application development.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. Steps involving account settings or advanced services should be verified in the live application.

Theory

Low-code work combines process analysis, data modelling, visual application design, automation, integration, testing, security and user support. It can complement rather than eliminate traditional software engineering skills.

Procedure

1. Identify roles related to the project: low-code developer, business analyst, automation specialist, application administrator, integration developer and QA tester.

2. Map skills learned in the insurance project to those roles.

3. Plan further learning in Deluge, APIs, data modelling, access control, testing and documentation.

4. Build a portfolio with screenshots, a data model, test cases and a short explanation of design decisions.

5. Review platform updates regularly and practice integrating low-code applications with well-governed external services.

Design / Observation Table

Career path	Relevant project skill
Low-code developer	Forms, reports and workflows
Business analyst	Claim process and requirements
Automation specialist	Triggers, Deluge and error handling
Integration developer	Connections, APIs and data mapping
QA / application admin	Testing, permissions and release control

Result / Conclusion

The project provides practical evidence of requirements analysis, low-code configuration and workflow thinking. Strong career preparation combines platform knowledge with general software, security and communication skills.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Guidance about deployment, security, integration or custom functions is not proof that the feature is already configured; verify it in the live Zoho Creator account.
