EXPERIMENT 13

Case Study: Limitations of Low-Code Platforms for a Complex Enterprise Use Case

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Analyze where a low-code claim-management prototype may need extensions, integrations or a different architecture at enterprise scale.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. Steps involving account settings or advanced services should be verified in the live application.

Theory

Low-code platforms can accelerate standard workflows, but constraints may include platform-specific scripting, service limits, complex integration needs, customization boundaries, data residency requirements and vendor lock-in.

Procedure

1. Define a larger scenario: multiple branches, high claim volume, external policy systems, fraud review and strict audit requirements.

2. Separate needs that fit native forms/reports/workflows from needs requiring APIs, custom functions or external services.

3. Evaluate scalability, performance, integration reliability, security, compliance, portability and total cost.

4. Identify a fallback for integration outages and a process for exporting or migrating data.

5. Recommend a hybrid design where low-code handles user-facing workflow and specialized services handle requirements that exceed the platform.

Design / Observation Table

Potential limitation	Mitigation / decision
Platform lock-in	Document data model and export/migration plan
Complex business logic	Use tested functions or a dedicated service where justified
Integration failures	Retries, monitoring and reconciliation
Large reports	Optimize filters and report layout; load-test
Governance at scale	Central ownership, environment separation and reviews

Result / Conclusion

Low-code is effective for many workflow applications but should be assessed against measurable enterprise requirements. A hybrid architecture may balance delivery speed with control.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Guidance about deployment, security, integration or custom functions is not proof that the feature is already configured; verify it in the live Zoho Creator account.
