EXPERIMENT 6

Automating Business Processes Using Deluge, Workflows, Testing and Debugging

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Plan and test workflow automation for claim acknowledgement, assignment and status progression using Zoho Creator workflows and Deluge where applicable.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

Deluge is Zoho's scripting language for workflow logic and data handling. Automation should be triggered by clear events, validate inputs, handle failures and avoid sending duplicate notifications.

Procedure

1. Define a workflow triggered when a new claim record is added.

2. Validate required information and generate or retain a unique claim reference.

3. Configure an acknowledgement email to the claimant if email sending is available and authorized.

4. Define a separate status-change workflow for notifying relevant staff or claimants.

5. Test valid submission, missing required values, invalid email, duplicate trigger risk and notification failure; inspect execution logs where available.

Design / Observation Table

Test case	Expected behaviour
Valid new claim	Record saved and acknowledgement sent if configured
Missing required field	Submission blocked by validation
Invalid email format	Validation prompts correction
Status changed	Only the intended status workflow runs
Email service failure	Failure is visible to administrators; record is not silently lost

Result / Conclusion

Workflow automation can reduce repetitive claim administration. The actual email or Deluge workflow must be configured and tested in the live Creator application; the supplied form specification describes the acknowledgement as an intended workflow.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is already enabled.
