EXPERIMENT 8

Configuring User Management and Role-Based Access Control

Insurance Claim Request & Processing Management | Zoho Creator

Objective

Define roles and access boundaries for claimants, claims officers, investigators and administrators.

Platform / Application

Platform: Zoho Creator. Application: Insurance Claim Command Center / Insurance Claim Request & Processing Management. Primary form: Claim_Request_Form. The LC-04 specification and supplied application export were used as the project context.

Theory

Role-based access control assigns permissions based on job responsibilities. Insurance records may contain personal contact details, signatures, addresses and claim evidence, so access should be limited to authorized users.

Procedure

1. List user roles and the tasks each role needs to perform.

2. Configure available Creator users, roles, permissions and report access in the application settings.

3. Allow claimants to submit requests through the intended public form or authenticated portal, according to the deployment model.

4. Restrict editing of investigation, surveyor and settlement fields to authorized staff.

5. Test access using separate test accounts and confirm that users cannot view or edit records outside their permissions.

Design / Observation Table

Role	Suggested access
Claimant	Submit a claim and view only their own status if portal access is implemented
Claims officer	Review claims, validate details and assign investigation
Investigator / surveyor	Access assigned claim details and update investigation fields
Administrator	Manage configuration, users and audit controls

Result / Conclusion

A role matrix provides a baseline for secure configuration. Verify permissions in the live application rather than assuming that the form itself enforces role restrictions.

Implementation note

This is a lab-record document tailored to the insurance-claim application. Steps describing integrations, AI, security, deployment or automation are guidance to configure and verify in the live Zoho Creator account; they should not be treated as proof that a feature is

already enabled.
